

SOMETHING ELSE (an excerpt)

Section Two - **SOMETHING ELSE** (A Snapshot of an Emerging Paradigm)

Introduction -

The essence of what will be shared with you here is the great human secret, it is the one thing that explains why we are the way we are. It is the one hidden underlying truth that - because we didn't know it - completely redefines not only where we stand now, but also exposes an entire landscape of possible futures we didn't even know existed. But this also explains why it will be difficult to grasp at first. It is not only because the potentials it all points toward are so dramatic, but because we will essentially be seeking to expose a secret that you are currently keeping from yourself.

Not everyone will be able to look. More importantly, the emerging rift between those who are able to do this, and those who are not, is a possibility you will need to be warned about before you even get to see it.

What this means is that the mere awareness of this particular aspect of life can produce dramatic shifts in the way you see things, and also in the way you conceive of your own future potential. It will reframe what the destination actually is in life, and which paths might best lead to that. And the same reframing will also naturally apply to the way you see the world as a whole, all of which can inevitably cause a deep shift in values.

Certain paths open up, and at that same moment other paths will close down. It is unavoidable. But all of that only occurs due to positive insight, in many ways so incredibly positive that the sudden hope and empowerment associated can be almost overwhelming. It can be very hard to contain.

And yet, there is an obvious issue with anything at this level - if this occurs in any social context where you already have firmly established 'unconscious contracts' with those around you, then such a dramatic series of changes can have a very disruptive effect. Basically, and especially if others have not taken the time to look at this for themselves - as many will not - then people will very quickly jump to the conclusion that you have suddenly gone completely mad. It will be very deeply disturbing on both sides of the rift, and really not that easy to resolve.

Indeed, this gap might ultimately be impossible to resolve, not short of everyone seeing what you now see, and walking the path you are now on as a result. And that will be unlikely at first, which is sort of the point I am making here. Not everyone will even be able to look, let alone walk the path defined.

I recently wrote a brief essay on this subject titled 'No Way Back' after a few people became 'philosophically marooned' in this sense, which in turn explains the publication of what you see here.

Previous to this, the only way to realistically get to a point where you grasp the most fundamental structure of this emerging paradigm was to sit down with me personally and have it all laid out. It is complex, and dynamic, and every person has erected their own unique set of internal defences - all of which are quite easy to get around in the context of direct conversation, but almost impossible in any static or recorded form.

I'm just warning you I suppose - this recorded form might not work! But if it does, then just what you see here will represent a watershed moment in the emergence of this particular body of information. The idea was simply to be able to release my friends from the trap I had inadvertently placed them in, which it may do, but in the process it could also begin a far wider cascade of interest. Which means they might get out, but only by putting a whole lot more people in that same bind.

To be clear, however, this was never the plan. Everything you see here was always developed strictly in private, and keeping it private was an important part of it. As indicated, not everyone is particularly suited to even looking in this instance, and for the most part the approach up until now has been to simply let those people sleep. In this case very strong aversion tends to translate to very low aptitude, so the idea was always to keep it under the radar, so to speak. So all of this is a very sudden and dramatic change, and that part will need to be explained here in due course also.

Fortunately, the possibility of this stress between people is only a very temporary situation. In time, and if what we will define here ends up being broadly correct, then everyone will eventually be confronted with this emerging insight, and the 'puzzle box' associated. But by then it will already have been opened up for them, and also very clearly confirmed as a foundational reality in any typical human life. So in that future context there will be no possibility that any sort of 'interpersonal rift' will be generated by such awareness. Kids will literally be taught this in their first year at school, under the heading of - 'the single most important and elusive thing we ever discovered about being human, and being happy'.

That is obviously a very big claim, and this is why it generates the rift being indicated. It is all the result of the huge downstream implications, the way this concealed reality has been so profoundly overlooked, and how it is now coming to light so suddenly.

In any case, you really don't need to look, and certainly not to do anything in light of what you see. This will be the main message we finish with here. At this stage this is all only for those few who want to arrive early and help set the party up. Which is to say - a great deal of stress might be encountered here merely as a result of showing up early. So if all you want is to enjoy the main event, when that eventually arrives like a tsunami of collective change, then you should just sit back and wait. In that case just show up again later.

Therefore, the choice to simply look away is actually a pretty good path in this instance. There really is a very realistic option to just ignore this entire thing and allow others to do all the hard work associated, until the whole thing arrives later in a much more accessible and practical form. Feel free.

The few who will have what it takes to open all of this up for everyone are probably very rare, and for everyone else the only thing you can really do is support them - find them, encourage them, empower them, etc - which means that nobody is trying to recruit you here. This event does not need followers. You are only being offered a sneak peek here, just an opportunity to take a brief look. That's all.

However, and as you will see, the very nature of the implied situation also means that 'merely looking' in this context will inevitably confront some very strong resistance at first, precisely because it is true.

That impulse toward avoidance will quite quickly dissipate once you reach even quite a shallow degree of penetration. But many people never make it that far, and will forever remain in a state of almost hysterical denial as a result. And for those people, by far the best outcome is that they are never confronted with this possibility in the first place, because the central insight associated with it can be very hard to forget. In other words - even if you do choose to look, please be careful about who you pass all of this on to. Even if you find it all pretty easy going, you might be surprised to find that

others around you do not experience the same thing at all. But it's not as if you can test anyone to see how it all might land for them, this is one of the rather unusual aspects of all this.

Due to the fact that the events in question relate to something that is currently being explicitly withheld from your own conscious awareness, what this means is that you cannot 'look first and decide later'. Even explaining how that might work would require the essential anatomy associated, so in some sense it is not even easy to say this much up front. But as I say, it is the great human secret, and even to say that much means it is no longer a secret, right? So it is kind of a catch 22. We will discover a few of these along the way here.

The point is: you need to decide now whether or not you would like to know this secret. And no, I cannot tell you what that secret is before you decide. Obviously. So yes this might of course seem strange, because it really is. But it is simply true that you cannot become aware of a process of active unawareness without in some sense dramatically altering the very thing you are looking at - bearing in mind that what you will be looking at here is yourself. Just seeing it will change you. It is implied, and not to be underestimated in this instance. To just begin this process by taking a peek can begin a cascade of unfolding awareness that only gets stronger and stronger and eventually changes the entire landscape - like a dog getting a whiff of a big bone buried out in the garden. Once the digging starts, it generally doesn't stop until the whole thing has been fully unearthed.

To be clear, however, there will be nothing to believe here, and nothing to take on faith. The things being explained are just plain facts, as far as I know, but that will be for you to ascertain for yourself. There is simply the opportunity to look here. For the first time ever. That's all.

Nevertheless, in this case it is true that things are a little more intense than normal. The situation in human life is not quite as we imagined it to be, and merely seeing what this means - and especially how deeply we are suffering as a result - can have a very dramatic impact. And of course you will be imagining that I am being a little dramatic in saying this, but you will see. This is not a joke.

So anyway - now is your chance to bail out. If you don't want to see - then please, don't look.

STOP HERE.

Okay, so you are still here. I suppose we will see by the time we reach the end here whether that makes you very smart, or very stupid. But either way - good luck! You are very brave.

Just don't ever claim later that you weren't warned. As they used to say - 'the pioneers take the arrows - the settlers take the land'. So it will be up to you to decide which one you want to be, and which one you are truly ready for.

This will be a major topic of discussion here as all of this previously concealed anatomy is gradually dragged out into the light. It is definitely not for the weak of mind, or the faint of heart. And we are going to be jumping directly into the deep end here, right from the start. The idea will be to simply lay it all on you, with full force, and in no uncertain terms. There will be no further warning shots fired.

Part One - THE HUMAN ENIGMA

In order to start this whole thing off we need only take a moment to look around at the world we see -

How are things going, do you think?

Or we could take the smaller view and simply look within ourselves -

How are things going there also?

Does it all basically seem okay to you? Or is it possible that there is something out of kilter?

This will be the claim here, right up front: Something isn't quite right, in both cases. Indeed, it's actually far worse than people generally imagine, which itself accounts for at least some of the manic chanting we see, as people everywhere are sitting there - as if rocking themselves - saying 'I'm okay! I'm okay! I'm okay!' Or as Thoreau put it - "Most men lead lives of quiet desperation and go to the grave with the song still in them".

There is a great deal of underlying suffering in the world, and if you either don't see this - or find it tolerable - then in light of what is emerging here that would define you as being very deeply afflicted. In this sense, even just the way you answer these two questions above will say a surprising amount about you, and in particular about how qualified you might be to play any meaningful role in what is about to unfold here. They function as a kind of litmus test for basic intelligence I suppose, not to mention a certain kind of fundamental honesty.

So if you answered either of these questions in the positive, as if you are just fine - and the world also, then you are most definitely in the wrong place here. In that case I suggest you turn back now, because anyone with that sort of 'sunny side up' approach to problem solving is going to absolutely hate this. This will be the extreme opposite to sweeping things under the carpet.

On the other hand, if you are already pretty sure that something just ain't right here, and are curious to see the true face of the beast that has us cornered - no matter how ugly that might be - then stay on the bus. Because that will be the destination here, and we won't be stopping until we get there.

Anyway, we already indicated that something very important has been overlooked. But what does this mean? And where might we look to see it?

One thing we might examine is the way we see ourselves in general, or even humanity as a whole. We can start off with the widest possible view.

What makes us so different?

I mean, we are animals, this much seems certain. We evolved alongside all the rest, but somehow we now stand apart in several important ways. We are almost no longer even recognisable in that context.

All animals have a sort of deeply encoded set of functions that help them navigate a shifting and changing environment, and if they have internal experience at all - which I think has been quite soundly established that they do - then this activity will be largely responsible for defining the nature of that subjective experience. What would it 'feel like' to be a cat, etc.

It is not that difficult to imagine. And it is also quite easy to see at least some basic alignment between the natural instincts and conditioned responses a cat might embody, and the elementary needs of a cat - at least when you place those back within the environmental context in which they evolved.

Essentially, cat tendencies seem to match the survival requirements for a cat, pretty much exactly. And this makes sense, if only because evolution ruthlessly eliminates anything that does not conform to this strict requirement.

But here's the thing - we can imagine being a cat, but a cat cannot imagine what it is like to be a human, or even come close. We appear to have certain very obvious capacities that define us as being somewhat unique in this sense, and the paradigm we see emerging here has a lot to say about this. In particular it helps us make sense at last of why we are so different, but also how we are a lot more similar to other animals than we had previously imagined. And the point of laying down these elementary foundations will simply be to try to reframe a lot of what you experience within a context that will then allow us to make several very important distinctions.

One of the main features of the central insight in this instance is that it is just so incredibly basic or fundamental that we struggle to even grasp it at first. So please bear with me here as I get some of this seemingly obvious or boring stuff out of the way. We need to set a baseline here, by establishing a bit of foundational anatomy.

Let me explain -

Two things stand out as especially unusual about us. First of all there is a particular convergence of functioning that allows us to expand our own internal experience very dramatically, and in ways that other animals apparently cannot do, at least not to the same degree. These functions almost certainly allow us to experience things like time and our independent sense of self very differently to the way other animals do - but the summary capacity we have is what we might generally call 'imagination'.

On top of all this added ability, like a kind of hard drive that we have filled up with collected data, we have developed culture and language and forms of cooperation that no other species can even come close to approaching. You might think of culture as a kind of operating system that we all both develop and share - we both take from that great collective download, as well as contribute to it, etc. But the basic hardware is the key here, and the various capacities associated. We can think - and not only about the world, but also about ourselves.

So that is one thing. The other thing that makes us stand out as very unusual is the way that our motivational landscape does not appear to match any definable pattern or evolutionary sensibility. Which is to say - we seem to want things that make very little sense, and the pattern of those drives does not seem to be in any way universally shared between people. It is as if our biological programming has gone haywire somehow, and sent people in all sorts of different directions, like billiard balls in a break.

Some people have sought to explain this sort of thing by pointing out the obvious disjuncture between the environment (and social structure) we evolved to expect and the rather artificial and novel context we now generally live within, but that is honestly so simplistic that it does not warrant more than a single paragraph - let alone an entire "World Transformation Movement". Not to mention that it would offer very little in the way of meaningful insight beyond 'embracing and to some degree transcending your inner caveman', or otherwise to 'just act like one whenever you can'. That conclusion would be facile to the point of being just plain silly.

If you examine things a little more deeply than that, what you will eventually observe is a pattern of behaviour that does not fit either of these environmental contexts. It is true that all of our historical patterns still reside within us, and also that we see an equally complicated body of adaptive strategies that relate to current circumstances, but neither of those combine to produce what we actually see

now. It is as if all of that has then been subsumed within a far broader and more complicated pattern that is both dynamic and also rather conflicted.

And here we come to the most elementary claim we will be making here, the quite simple assertion upon which all the rest will stand -

The two things that together make us very unusual, and from which a huge amount of our own personal experience is derived, are directly related. And of course you might think this is completely obvious, but I do not mean this in the sense you will be assuming.

The key thing here is that the truly intrinsic and amazing thing about us - our capacity for imagination, etc - was an entirely positive evolutionary leap, a convergence of various functions that quite suddenly allowed for a big jump in our 'survivability' so to speak, and therefore allowed us to master our environment and essentially take over the world. But also that this new cluster of capacities arrived carrying one rather unfortunate hidden potential - sort of like a trojan horse - and thereby introduced an issue that has since set our compass spinning wildly.

It was as if we took our car in to be serviced - and they put a much bigger motor in for us, but also removed the steering wheel, and the brakes. And so, the very twisted and distorted motivational landscape that remains in the wake of this leap in capability no longer so clearly conforms to the natural pattern we might expect to see - it is not positive at all, and certainly not intrinsic. But the two things - our recent power and our evident confusion - are actually quite deeply related in this sense. It's just that one of them is a legitimate advantage, whereas the other is merely an unfortunate and temporary hiccup.

To put all of this in very simplistic terms, it is as if we got a recent update to our operating system - an update that came with several very significant new features - but an update that also had a very serious bug. And this is, when you unpack it fully, what accounts for the full picture of the simultaneously beautiful and tortured enigma of typical human experience.

Part Two - TWO THINGS NOT ONE

If you look up the word 'happiness' in the Oxford English Dictionary, you will find it is defined quite simply as 'the fulfilment of desire'. Of course, there is a lot of talk these days about the whole idea of happiness being something of a red herring when it comes to the achievement of a good life, with meaning and purpose starting to step into the cultural spotlight as better ideals to aim for. There is also a growing awareness that very few truly significant paths in life can be travelled without at least some degree of sacrifice, suffering, and loss - which once again stands in stark contrast to the typical and very simplistic view of happiness.

And yet the subject will still be useful here, if only so as to demonstrate the implications of what we will be unpacking in what follows. Most especially, it remains relevant here because we will be gradually setting the stage in order to understand one very significant potential that does - amongst other things - deliver an enormous amount of happiness.

Therefore, we will use happiness here for a moment just so as to begin to explain the nature of the bind we have ended up trapped inside, as well as the obvious implications of that bind being released.

Consider this -

If happiness essentially equates to the fulfilment of desire, and if the structure of desire is supposed to represent at least some sort of basic biological imperative, then the fulfilment of desire should naturally result in positive outcomes for the body.

I mean, it is possible you have never conceived of yourself in these terms, but there is a basic hierarchy we see here - and in all animals - that makes complete sense. The body developed all of the functions we see in ourselves in order to navigate a complex and moving reality, and so it is implied that those functions could never just 'go rogue' so to speak.

In the same way as an elected official might be given power only insofar as they serve the constituency they stand for, all these 'higher' functions likewise have a job to do, and if they don't do it they will (unless they are very corrupt) always suffer the consequences.

Therefore, we see a kind of hierarchy emerging over time as animals evolve, a pattern that is reflected exactly in the way we have come to function.

In very simplistic terms you might split the layers of this pyramid up (from the bottom) into physical, emotional, and mental.

The basic process at the bottom of all this functioning is called homeostasis - and what this means is that there is a certain natural balance that needs to be maintained both in terms of physical wellbeing, but also in terms of situational advantage. State and circumstance, you might say.

Which is to say - you might be dying of pancreatic cancer in a billion dollar penthouse on Park Avenue, or you might be fit as a fiddle but standing on the deck of the Titanic. Neither of which are very good, and both of which might leave you feeling less than overwhelmed with happiness.

At this stage, and in order to explain how homeostasis works at these various levels, we can introduce a metaphor you will find repeated throughout much of what follows - the idea of the 'ball in the bowl'.

Consider ideal functioning for a moment, or at least the aim of ideal functioning. What is the perfect state for any organism, or the perfect circumstance?

Your definition might vary slightly based on however you tend to view such matters, but that is not really the point. The key thing to focus on here is that your definition is generally singular and integrated. Like the perfect symphony played perfectly, it is an overall singularity. Like writing your name on a piece of paper, there is really only one way to do it correctly, and all other ways are, by definition, some variation of wrongness.

This is how we get the analogy of the bowl. You could just place a ball on a wedge shape, and say that positive is at one end, with negative at the other, and that the body will make sure the ball of behaviour over time will always tend to roll toward the positive (lower) end by generating stress as the ball is pushed away from ideal states of wellbeing - stress in this sense being represented by elevation. Hence the wedge - it is like a ramp that always tends to roll the ball down toward the thin end where emotional tension is the lowest, and transactional need fulfilment the highest. But when you add in the idea of the positive being singular, and the negative being infinitely varied, you suddenly see the thick end of the wedge spreading out, and thereby spinning around to create the bowl shaped dynamic.

Therefore, what we see in homeostasis is the ball resting in the middle of this bowl most of the time, this would be the naturally fulfilled and healthy state. But then life will come along and perturb that equilibrium and thereby move the ball away from that ideal point.

So how does the body move the ball back again? What is it that generates that wedge shape and thereby the force to press the ball back toward the middle?

Here we see the function of emotional drives and tendencies which, in animals, are modulated by instincts etc - genetically transmitted behavioural tendencies.

In any case, the subjective experience will be that any situation where need is not being met at a physical level will 'feel bad' for the animal in question at an emotional level, and that the body thereby motivates any executive functions to act in ways that manage to successfully resolve the tension associated. The body needs energy and nutrients, the emotional level feels this as hunger, food is sought out and eaten, and the entire event once again resolves back into a still and energised positive state - the perpetual 'reward' the executive level receives for a job well done. Bliss.

In our case, then, we have one more level on top again - the 'conscious actor'. But the same basic principle applies. The emotional level simply passes the tension up the chain to a more complicated body of functioning that is far more likely to be able to achieve the outcomes required. But just to be clear, it remains in almost complete control, in just the same way as the body retains control below that.

The key thing is that the higher should always be a reflection of the lower, and that the entire system must ultimately conform to the very narrow dictates of natural selection within the very harsh environments in which we evolved. Which is to say - the entire system should be lean and mean, and extremely efficient in achieving its obvious outcomes. There is simply no room for fat, no margin for error etc, not in behavioural terms. Anything like that and we would never have survived long enough to pass on such overly quirky genes.

Anyway, what does all this mean? What does it relate to? It all points to a very basic kind of anatomy in relation to what we tend to experience as our waking conscious life. We always tend to imagine we are living, but in fact we are 'being lived' by an enormous and complicated process that has this basic structure and the functions indicated. So if ever you want to be truly happy, then you really need to get with what the game is here. In particular, you should understand the most basic of all realities in this context - that you are a servant, not a master.

That's really all it is, there is nothing more than this. And it really should be this simple. It should also produce constant and perpetual fulfilment at an emotional level, assuming you are not starving, or freezing to death - and that you have someone to talk to, etc.

That doesn't sound right? That's not what you experience? Constant energised bliss? No. That's sort of the point.

So what's going on? If this is not the pattern we see, then what has gone wrong?

To see this in very simplistic terms we can go back to the 'happiness over desire' equation, and turn it around. If happiness is the absence of desire, then what is the presence of desire?

It is unhappiness, right?

So consider this once again -

What would happen if some evil gremlin got hold of a remote control that was able to generate powerful and random desires within you? And I mean real emotional loading, not anything fake or somehow spurious. After all, how could you tell the difference between a fake desire and a real one, especially if you were not aware of the underlying structure just outlined, which most people aren't?

Two things would happen in that instance -

You would be driven to seek to fulfil the random desires, whatever they might be, at least up to the limits of your ability - and thereby expend massive effort and resources in the direction of action that is actually completely redundant and unnecessary. And then, beyond the level where you could no longer effectively achieve such fulfilment, you would suffer from unfulfilled desire - aka: unhappiness.

Constant and restless effort and a pervasive, mysterious, sense of persistent unhappiness.

Does that sound in any way familiar to you?

But I'm really not that unhappy! I hear you say. And yes, that may even be true, but we are only using this as an example here, as just one of many forms of the underlying event we will be pointing out. But hopefully you can see that this particular variation is very common, perhaps even in most people, at least to some degree.

The point of this metaphor is to elucidate one single fact - which is that a conflict beneath the level of conscious awareness is a conflict that cannot be resolved, or even examined, by the conscious mind. And this is because the conscious mind is always looking *from* such a conflict, rather than *at* it.

We are now at a point where we can begin to see what is really going on, and normally we would be doing this in much more detailed resolution - after all this comprehensive anatomy is sort of the point of what this emerging paradigm offers. But in this instance we are just sort of zooming out instead, and won't need all the tortured detail in order to basically weigh the whole thing, and to see what it all might mean. It is not that complicated in essence, and what it all means is likewise not beyond reach for most people.

The big secret at the core of human life is that there is not only one thing going on within us - but two distinct processes. There is the natural and healthy underlying pattern of behavioural tendency, but that is lying beneath - and tangled up with - a far more dynamic and complicated subversive event.

We have already broadly addressed what the natural functioning might be seeking to achieve, and very roughly how it might do that. But what about this added event? What is it trying to do, how does it do it, and more importantly - why?

This is a complicated story that will eventually require a great deal of structural anatomy to fully articulate, but in essence the second event is trying to conceal something. And this aspect is very important to grasp for several reasons.

Firstly it is important because - in a system that is so deeply oriented around conscious awareness as one of its defining principles - to be limiting awareness is always going to come at a very high cost somehow. We are really not supposed to be keeping secrets from ourselves, but in this case that's exactly what has happened.

The other reason this is important is because it means that any attempt to point this second event out to anyone will immediately confront the very activity itself. Which is to say - the very thing you are pointing at will itself prevent anyone seeing the very thing you are pointing at.

I mean, I'm not sure if you can easily get your head around it at this stage, but the thing being avoided in this instance (the thing that is causing all the problems) is itself a process of very active and dynamic avoidance.

If that doesn't fuck with your mind then you didn't quite grasp it yet.

So here we see the big bind. At this stage we will not even get into what this activity might be seeking to keep from conscious awareness. It is enough to say that it is big.

In any case, the relevant point in this context is that in order to conceal something rather obvious, this activity must also hide itself. Conscious waking awareness (you) is allowed to see neither, and this 'torrent of active blindness' must be maintained permanently.

Therefore, we see three different events here, all wrestling with each other in a sort of restless struggle, but for the most part one of them is never directly experienced, except perhaps in occasional nightmares - that being the thing that is being hidden. You might think of that as being a bit like a smouldering fire, and that attention will only tend to fan the flames, which is why the unconscious is charged with keeping the whole thing perpetually buried and out of sight.

The other thing to know about this simmering unconscious dread is that it is made entirely from healthy functioning - which is to say: from the natural and normal tendencies we outlined previously, all of which are deeply anchored in the body, and also linked to many other systems as their source of integrity.

Why would this matter? It is important because it explains both the explicit aim of this added body of activity, as well as all the various methods it might naturally employ along the way to maintaining this singular underlying 'concealment' outcome. In particular, it explains that this secondary activity is potentially vast in all of its various expressions at any point in time, and also that it is necessarily dysfunctional by definition. But most importantly that all of that - in all its forms - is actually just a singular event.

At this point we are beginning to map out the true behavioural anatomy of a typical person here, and in a truly powerful and comprehensive sense. We see all the main players, along with all of the potential dynamic interplay that might be manifest at any point in time. We see the natural system beneath it all, as it struggles to express itself freely. And out of that we see (or don't see in this case) one emergent potential that the unconscious simply cannot allow free expression to. Which in turn supports the active and very pervasive maintenance of a sprawling process of active repression, a battle of wits, where the active and ongoing subversion of natural functioning is simply implied.

There are many forms this 'concealed dysfunction' might take, it is literally as complicated as the anatomy that is being subverted - which in this case happens to be the summary output of the most complex single structure we have ever discovered in the known universe. But over time, a sort of equilibrium is achieved in relation to all of this activity, and a 'new reality' is established.

Importantly, this entire thing is a battle the conscious level of experience doesn't even know it is fighting. It is completely invisible. It is as if the 'conscious self' was picked up and then put back down again, and that apparently nothing had changed from a conscious perspective - and yet nothing is

ever the same again. Somehow the game is now rigged so that it can never win - as if it wants to stop running but that the finish line just keeps on receding into the distance ahead of it.

As indicated, there are actually so many forms that this can all take that picking on any of those in isolation would give a false representation of just how epic this activity really is. But one primary form can probably be pulled forward as broadly indicative of how silent and slippery it all can be.

That aspect is the way the whole thing places a limitation on feeling, and remembering. We eventually discover that our capacity to feel has been quietly diminished over time, which could take many forms. We might hold energy in, or withhold energy from, certain parts of our body. We might adopt a certain postural alignment that functions to contain or discharge particular emotional states on a perpetual basis. Or most commonly of all we might simply learn to never again breathe naturally and fully.

So why feeling? It is because feeling leads to remembering. It is because feeling is the guardian of wholeness, and wholeness will always lead us back home again, which is precisely what this added subversion cannot allow. And I'm sorry for being so vague here, but we simply don't have the space here to unpack all of this in any higher resolution.

In any case, what could be so bad that we don't want to remember it? And yes, there really is a truly thundering dread at the root of all this activity, but that is not what we experience in an everyday waking sense. The whole point is that we never even come close to experiencing that if we have all of this activity stacked in just the right way. So it is only that surface level behaviour we are talking about here, and in that sense it is often not the negative we have lost touch with. That's not how it works at all. It is heaven that has been forgotten, not hell. It is hell we are already in, and which is only now bearable in the absence of any awareness of what we have lost.

It is through the loss of remembrance, and through a gradual numbing down, that we once again manage to establish some kind of stable equilibrium in the wake of this event taking hold of us. And this is why people will often say they 'don't feel alive', but also why they don't generally know exactly what they mean when they say this, and usually can't point to anything specific.

There are many possible ways you might allegorically represent a situation where what might normally seem like a rather simple function might require a massive and complicated pattern of behaviour to suppress. It would be both rather simple but also very complex and dynamic.

Perhaps imagine that you were charged with preventing someone from speaking. That is a pretty simple and natural function, right? But how many ways might you come up with if doing so was suddenly very important somehow? You could get a whip and give them a good old crack every time they even looked like making a peep. You could get a big drum and place it over their head, so that nobody could hear them, even if they did speak. You could literally hold your hand over their mouth if need be, etc. And there are a whole bunch of significantly more violent ways, if it came down to that.

Now imagine that the functions associated were not so trivial, indeed imagine we were talking about suppressing the very core of our own functional integrity, or otherwise disrupting natural and normal systems in all manner of ways.

It is obviously a dark picture, but yes - it really is dark - far worse than we tend to imagine at first glance. I mean, if you could have this entire complex spontaneously removed you would experience an unbelievable shock. It would be like awakening from a sort of visceral nightmare, where you were being suffocated under the weight of an invisible bull elephant seal. You just don't realise because you have been under it for years.

The other result of this added event being so dynamic and disruptive - which is to say, big and has many forms - is that the fusion of these two events over time, in such a ubiquitous manner, has left us completely unable to clearly differentiate the natural underlying functioning from all the added noise and mess. And what this means is that every picture ever taken of the so-called 'normal' human state is actually a picture of two things, not one.

We always measure the disease along with the underlying person, as if they are a unified whole, when actually this is not the case at all. It's just that all this disruption has muddied the water to such a profound degree that the true anatomy beneath it all has been obscured from view, and as a result the two events have never been practically or theoretically separated. And in the wake of that we remain completely at the mercy of an event we cannot even see, but which we suffer from nevertheless. The perfect trap is one that you don't even know you are caught in.

Part Three - THE COMMON STATE

One of the big mysteries this emerging anatomy solves is the apparent variation in human motivation and belief. There are many forms of this added subversion, many ways it can express itself, and these very sophisticated 'coping strategies' are very often inherited from our family or culture. But no matter which form you might end up embodying at any point in life, the one thing you will never naturally grasp is that all the other expressions of culture are actually just the very same thing in a different form.

I mean who is worse - alcohol, religion, or obesity?

Yes. All of them. They are all worse than the natural human state. They are all just compensating for the loss. It is all the same thing. Just one thing. This is the essence of what the paradigm seeks to offer. It is all about providing an anatomy that is detailed enough to be comprehensive, but also simple enough to be powerfully applicable. And the result is an emerging picture of the typical human state that is actually quite basic in its elementary structure, but also incredibly dynamic in all of its possible permutations. Which in turn provides us with a very robust model for the overall functional potentials of a typical human being - what I will generally call the 'Common State'.

Perhaps the most obvious and important thing to know about the 'Common State' is that it is exactly reflected at a collective level in the form of 'Common Culture'. And once again the same insight can be applied at that wider level - after all the collective is nothing but a group of individuals, so if the individual tributary is polluted then the river will be polluted as a result.

Hopefully you are noticing here that at every point on our journey we are gradually collecting various implied mechanisms by which the very thing we are seeking to point out might be avoided or denied. Which is to say - we are looking at various processes of active blindness, and exposing processes of concealment. And you might not notice this at first, but in merely examining these various modes of avoidance we are in some fundamental sense also undoing them.

In the individual we see not only emotional aversion but also the potential of cognitive degradation, along with many other possibilities. And at a cultural level we see the same thing - a pervasive banishment of anything that might potentially lead in this direction, right down to the absence of even any language with which you might talk about it with anyone.

So what does separating these two events allow for, now it is possible? And how exactly might we do that?

In overall terms the functional differentiation required to bring all of this into some sort of clockwork clarity requires that all of the events associated be defined within a singular anatomical model, and in particular one that is itself defined in just the right terms.

One obvious strength of the completed model is that it solves a million longstanding philosophical dilemmas and psychological conundrums. And it also does this in a very surprising way in most instances, in that we have essentially split the pumpkin of humanity right down the middle here.

For instance the age old question of whether we are good or bad -

And the answer is? Yes. Once again. Both.

Intrinsically we are good, broadly speaking, with a bit of evolutionary baggage thrown in. But in practice we very often tend to be bad, if only because we are afflicted with something that in many cases forces our hand.

The problem with this whole insight, however, is that it is 'existentially demanding'. It is first of all complex in its fully rendered form, and with all of its extended implications and theoretical support. It is a body of interconnected information broadly equivalent to an advanced university level education. But that is not the hard part. The real challenge lies in what we have already hinted at along the way - the true fight is against your own mind, and more importantly against the mind of others in exactly the same sense. The true battle is with the event itself, which is currently roaring away just beneath the surface of your otherwise calm interior. So if you have a 'lazy mind', or are not generally capable of even a modest degree of penetrating introspection, then you will tend to begin drowning here the moment our whole exploration gets a little deeper.

Fortunately the anatomy itself represents a kind of master key in relation to examining all of this in yourself, in that it allows you to immediately objectify the entire system, and thereby progressively gain a very real and powerful degree of transcendence over it as your awareness increases over time. It is as if you go from living with a wild tiger in your house, to living with a tame tiger in your house. You still have a tiger in your house, but it is definitely a lot better than before, and at least you get to study the tiger up close and personal.

The key thing to see here is that the entire relationship between the conscious and unconscious can go through a dramatic transformation in this sense. First of all the entire 'blindness' associated with the underlying event seems to fall away all at once in a sense. It is a bit like a balloon - at first you push it, and it pushes you back. But keep doing it far enough, or with enough penetrating clarity, and suddenly it will pop. At which point you go from not really seeing any of it, to suddenly seeing all of it. Where before you didn't see it anywhere, now you suddenly see it everywhere - both in yourself, and in others. You might even come to wonder how the hell you ever missed it, given just how completely obvious it now is.

And your own loaded emotional aversion will shift in just the same way. At first it is always very uncomfortable, as your own unconscious sends up warning flag after warning flag as you head into it. It just feels wrong. But sooner or later it is as if you find the light switch as you fumble around in the dark, and suddenly all the scary shadows in every corner are just chairs and broomsticks.

So there you are - you have finally seen it. The whole thing, the entire turbulent and tortured human state laid bare before you. And suddenly, with the answer right there, you realise you didn't even know what the real question was in life. The blindness associated was almost complete, and the way the entire thing sets your emotional compass spinning also means that you were never going to break free of that on your own. Not without help.

Once you see all this, there also emerges a profound sense of compassion for the typical person, and a new appreciation of the basic courage we see everywhere. If people knew what they were really up against, and just how formidable it really is, they would feel a lot more proud of how they have done. And yet, if you knock on their door in order to tell people, guess who will answer the door. It will be the unconscious that you confront, and the conscious mind will never even be told that you dropped by.

Anyway, the relief is profound. It will eventually start a kind of fire in your mind, as one thing leads to the next, which leads to the next, as question after question is answered. And by answered, I mean - completely resolved. On top of which is added an ever increasing degree of insight and empowerment in relation to something that had previously been mauling you to death for your entire lifetime.

But that's not it. None of that is it. The answer to all of our problems was never going to be just a bit of philosophy, even if it does solve thousands of problems at that level. That's really only the wrapping paper in this context, all just bonus in a sense. Nothing ever prepares you for what comes next, and what it all might mean.

Part Four - SOMETHING ELSE

We mentioned earlier that what we will be explaining here is without a doubt the single most important thing to know about being human. And now we come to why. It is not to do with what it explains, although that is crucial. It is not to do with any degree of transcendence or insight associated with gaining any amount of direct personal understanding.

There is really only one very important thing that our persistent unwillingness to face up to this most central reality of human life has prevented us from seeing, and that is not just the fact that it is there in the first place. That may be true, but merely seeing it is not enough. The only really important thing about this added body of subversive activity is that it can be entirely undone and removed.

It is implied in the anatomy associated: it can be relinquished, and once again resolved back into its fundamental state - nothingness.

That is essentially what it is when you boil it all down. It is nothing. And yet it is all very real. Devastatingly so. It really is the root of almost all human suffering. But ultimately it is just like a kind of dance we are doing, not any kind of objective presence in the world. And what is a dance when you stop dancing? It is nothing. Apart from the activity itself, it does not exist.

And yet, we cannot simply stop. This is the dilemma. We are forever bound in a cycle of subjective captivity. The event will not spontaneously undo itself, even when you see the entire thing laid open before you like a dissected frog in a science class.

This is what stands to change here in light of the core anatomy finally becoming clear. We do actually see this 'free' potential occasionally, in rare individuals. But without the essential information required in order to truly fathom both the depth and nature of the event that was removed, those concerned are

left to fumble around in the dark explaining to people what it 'felt like' to have that experience. After all, they didn't see it when it was there, and now they don't even have one to study. And this is why they persistently fail to repeat that transition in any of those who seek to 'get' what those people 'got'.

And it's not as if they are not well intentioned, after all what they are explaining is a real thing. They just don't know what it actually is. Which is sort of the point - our entire culture doesn't know this at this point in our history, whereas in the future this will be common knowledge. Even school kids will know it, as I say.

So what is going to change here? What difference does knowing the deeper anatomy make?

Think of it this way -

Imagine for a moment that the human potential that has historically been called 'spiritual enlightenment' was real, but that it has also been severely misunderstood, and just as deeply misrepresented as a result. But let's say that all this potential happens to be - in truth - is just the removal of this vast and added complex of subversive activity we have been defining. Bearing in mind, of course, that this is an event we cannot presently see, even though it is standing right in front of us.

In any case let's just do a thought experiment for a moment, and assume that this possibility exists - first of all that a big section of what we presently presume to be 'ourselves' is not actually 'us' at all, and secondly that this entire part can be relinquished at its root, assuming you have some way to know where that is.

Therefore, let's take any example as a model. Perhaps Eckhart Tolle for instance. Or Adiyogi Sadguru, take your pick. There are probably hundreds to choose from if you look hard, and yet none of them are pumping out people who have reliably passed across this very clear threshold.

All I am saying is that they are approaching the entire question from the wrong angle, with the wrong information, and as a result they are getting the wrong outcome. People simply don't get it. But in the future they will, and I am about to explain why.

So think about it - there is a prior conflicted state, and then there is some kind of liberated state.

Is that right? This is what they seem to be claiming, and it is also what I am claiming here, make no mistake about that.

What, then, is the essential threshold that separates these two states?

Is it gradual, or is it sudden? Is there a spectrum of possibility here, along which you might travel in order to 'get closer' to that potential transition, or is it basically instantaneous, in which case there is no way to move 'toward' it in any meaningful sense?

But if it is gradual, then is the realisation gradual, like a continuum of awakening? Are there people who are 'more awakened' than other people who are 'less awakened', and then others still who are 'not awakened at all'? The entire thing is very confusing in this sense, and this is deeply reflected in the way people approach the entire subject.

Here is what is actually happening -

There is indeed a continuum of potential along which you might travel in order to approach and eventually cross this important threshold. And that threshold really is a singular defining moment.

Yes. It is both. Once again. We are going to keep getting this answer here, but it is not meaningless or circular as you might imagine. It is directly applicable in this instance, and also rendered in terms that will very quickly make all of this practically accessible to everyone before too long.

Think of it this way -

Your task is to push a big heavy ball up a small hill and then roll it down the other side. So you start to push it in the direction of the end point you are aiming for, but there is resistance, and it all takes effort. Maybe you get tired of pushing the ball, and you let it go for a moment, and all of a sudden the ball rolls back down to the bottom of the hill. Damn.

So you start again.. ad infinitum. Well done, good try. Welcome to Satsang - please pay your fees at the ashram office, and come back tomorrow to try again. We appreciate your endless devotion.

Two things matter here -

First of all, which direction you are pushing that ball. We can now return to our ball in the bowl metaphor from above and begin to see that in an entirely new light. What we see once we add all of this extra detail to our picture is that we are once again trapped in a similar dynamic, except that this time our stable bowl is not actually the natural one we biologically expect. Instead of that it is as if we have landed in a small and shallow depression next to the big and open one we actually belong in. And sorry if these metaphors confuse you a bit, but if you stick with me then hopefully you will find this helpful.

The whole point is that the situation we have found ourselves in looks exactly like the one we biologically expected, but that somehow things just don't seem right. And this is where that metaphor can help to explain the conundrum, as well as the obvious solution to it. So perhaps imagine this big motivational bowl as defined by evolution over vast spans of time, and that right in the middle is the ideal functional equilibrium. The depth of that bowl is basically emotional fulfilment - happiness. And the location of that middle point is basically physiological wellbeing - health. They align completely in the natural human state.

This is how it should look. The whole thing should look like that huge meteor crater out in the desert in Arizona. But then imagine this dark scenario - now think of another small crater just next to that big one, a lot more shallow and also clearly off-centre from the point of energetic integrity in the middle of the big bowl. What might things look like if you happened to be a ball who was stuck in that small bowl instead of the big one?

Would you even know? But in that shallow state, what would be the greatest happiness you might ever achieve? And in that location, what would the physiological results of seeking such 'misaligned' emotional fulfilment be?

There you are, then, stuck in this shallow depression. Boy if that doesn't sound like the typical life? Shallow depression, no pun intended.

Anyway, in which direction is the big bowl? How would you know? After all you can't see it from where you are standing, down in the middle of this other small bowl next to it.

This is something only the anatomy can tell you - it can define exactly which direction that movement should be taking you if you wish to transition across that hump and back into the natural state again.

The other thing a comprehensive grasp of the core events here can allow you to ascertain is exactly what defines that threshold between states. It is all about understanding the nature and reality of the emotional pressures associated with the transition up that hill, after all that's what elevation in this model represents - it indicates motivational stress.

So this is the key thing here - it all indicates that there is something you need to do here that you really won't feel like doing. But that does not mean that everything you don't feel like doing will achieve this great and singular release, because it is only in one particular direction and also only stands to be fruitful in this sense if you understand exactly what you are doing, and why, and also only if that entire venture was pushed to a point where it went beyond that critical release point.

There are certain things you would need to have in your backpack for that journey, so to speak, and if you don't have them then you will inevitably fail and just end up rolling back down into the typical state, completely exhausted and defeated. And so, that will be the key here - it will all be about defining exactly what that transition is, and what will be required in order to make crossing that threshold both accessible as well as very reliable, in a way that you will never need to attempt twice. I mean, when you fly to London, they don't say 'we will try to get you there today, but if we don't manage it, we will try again next week' - and then continue to do this for years on end, forcing you to live most of your life in the airport lounge. But that's exactly what we see in all 'spiritual traditions' available at this time in relation to this essential transition event, precisely because they don't even know what it actually is. It is all just amateur quackery in this sense, as I believe time will tell. And this is where science needs to step in and clean up all this mess once and for all, as it has done in so many other important areas of life.

Therefore, let's say you have figured out which way you need to push the ball in order to define the optimum path toward that critical threshold, what then? Well, then you move. How do you do that? The anatomy also defines this. It indicates both what might best be done in order to most effectively facilitate such movement in your own particular case - bearing in mind that your own expression of the dilemma in question will be completely unique to you. So your path will not be the same as another person's path, and this is why you need a comprehensive and dynamic model to work from.

Anyway, let's say you have such a map and have been able to define which direction to move. What are you likely to confront along the way?

Stress, lots of stress. The entire ball of string will begin to unravel, years of suffering and struggle - indeed it will actually get much worse as all of the subversive activity begins to struggle to contain the underlying event beneath, and you basically start to catch on fire again, emotionally speaking. The unconscious mind will be screaming with alarms, and your adrenal system will be frying. But still you know the way, that this is normal, and so you keep on going.

Fortunately, you have a fire extinguisher on hand to put this fire out as all of the wet blankets are finally removed - this is another thing the paradigm offers. But progress remains slow, and the sense that all of this is somehow very dangerous is palpable and real. The ball goes up the hill.. up, up, up. And then suddenly you are at the top, and the ball is balanced there, strangely stable, but also at a point of profound stress and tension. Welcome to the dark night of the soul.

This peak of tension is the defining threshold between one state and the other, and this is how the whole thing can be both a continuum as well as a single point. The continuum is the entire journey

from the middle of one bowl to the middle of the other bowl - and the essential transition is defined by the moment when the tendency of the ball to roll backwards is replaced by the tendency to roll forward into the new stable state. From one stable equilibrium to a new stable equilibrium, one that is centred around a completely different point of natural integrity. Hence - 2EQ.

There are actually two stable equilibriums available for the typical person, not just the lost and tortured one we know now. And with every inch of movement beyond that highest peak of tension that transition back into the natural equilibrium becomes more and more confirmed, and thereby less and less likely to ever go back to the previous state. I mean, you would literally need to get around in front of it after that and push it back over that hill, and why would you want to go back to hell? This is why that transition is always essentially permanent.

In structural terms, this transition point can also be precisely defined, assuming you have all the associated variables captured, which is another thing the deeper theory does a pretty good job of providing.

There is obviously a lot more to all of this than what we are offering here, in that the thing you are pushing up that hill is not actually a ball - it is a very cunning ten limbed slimy octopus, and you need a different type of stick to push each part of it. But you get the basic point - there is a threshold which, once crossed, means that you can essentially relax and go for a ride - all the way home.

So are there 'degrees of spiritual enlightenment'?

Well, first of all that's a silly name now really, given what this transition actually is. We need to lose the erroneous jargon. But yes, there are indeed degrees of it - every step along that journey is one more degree of progress toward the final destination, which is a return to full and open functional integrity - a point where 'what feels good' and 'what is actually good for you' completely align again naturally.

And yet, are you 'completely enlightened' the moment you cross that halfway mark? Yep, pretty much. Because although there is still a long way to go, all the rest essentially becomes a fait accompli beyond that point. The balance has then been tipped, so you can either keep on pushing, or just roll away naturally. It doesn't really matter beyond that threshold. All roads then lead to Rome, whereas prior to that point no roads did.

There are also degrees of humanity, and this is more important to understand. What we see here is just the removal of a compounding affliction, a sort of hobbling that previously acted like a very serious burden in life for any individual. But people themselves are very different, and all this transition does is liberate you from this added affliction. It does not produce any degree of development, not unless that burden just happened to be artificially suppressing various functions that can now grow back freely.

Which is to say - if you are an aggressive person, then after this you will simply be a happier and less inwardly oppressed aggressive person. If you are an asshole, then you will simply be a happier asshole. And if you are really fucking dumb then this will not somehow make you a whole lot smarter. None of those things relate to this at all.

Personal development and psychological variation exists on a completely different axis to the events we are defining here. And this once again relates to our 'degrees of enlightenment' question above - because this transition in a very highly developed person might express itself very differently to the same thing in a deeply incompetent individual. In which case the real question becomes - are there 'degrees of humanity'? And the answer to that is - yes. It is as if this transition merely puts broken pots

back together, and in that sense it is sort of universal, but the shape and function of those pots - once fully reassembled - varies enormously.

Which is to say - Buddha was a freak of nature long before he had his seminal realisation. Indeed, anyone who ever found this transition point without a map was probably some kind of extreme and eccentric weirdo, but in the future this will not be the case at all.

Therefore, we come back now to examining how so many contemporary teachings conceive all of this, and why they don't have much luck in repeating that transition in anyone but the most extreme and determined adherent. You will often hear a 'spiritual master' exhorting his adherents to 'just let go' as he once did. But now you see - that is completely worthless advice if you still happen to be on the wrong side of that threshold, and especially if you do not even know that such a threshold exists, or what might define it. Both effort and release are completely irrelevant in this instance, once you see the real continuum that defines this essential transition and the exact direction of progress in that regard. There is no guesswork involved. You don't need to kiss anyone's ass, or lay lotus blossoms at anyone's feet.

Many other such examples could be offered, with that being only one thin slice of the total landscape the full theory defines in relation to how this massive trap works, and how anyone might get out of it. But the one thing that stands out above all other factors in this regard is that the anatomy in this instance is defined in entirely functional and practical terms. It is not in any sense mystical or spiritual - that is completely misguided terminology, and it needs to be entirely left behind, as I say.

This is science. Indeed, it is probably just engineering, perhaps coupled with disciplines like dynamic complexity and systems theory. Who knows where it might land, it might even be the perfect test case for an emerging AI. Anything that can confidently model the complex and fluidic dynamics of an ecosystem, for instance, will be well suited to this sort of work.

In the absence of all that, however, where it does still leave us is with a body of theory that is entirely able to both orient and inform a process of collective development that will inevitably - and probably quite rapidly - begin to generate direct practical empowerment.

We don't need to wait around for someone in a robe to show up and - as a longshot, perhaps, maybe, eventually - assist a single very dedicated individual across this threshold. With the hidden anatomy coming into view at last, we can now simply make this happen, everywhere, for everyone, all at once. The potential being defined belongs to everyone, it is our natural birthright, and it should no longer be held behind a veil of ignorance by people who very clearly have no handle at all on what it actually is.

History is going to show all of that wheel spinning nonsense in a very poor light here in due course.

On the other hand, and if all this turns out to be correct, then all those with the basic humility to see where they got the whole thing wrong might be very well positioned to retrofit their entire teachings so as to place it on top of this essential missing foundation, and thereby revolutionise the effectiveness of their efforts. It will be interesting to watch. I wonder how many will respond in the same way that Kodak did to the emergence of digital cameras: by not accepting that their current technology has now been entirely outdated, and imagining they still had a future. Who will adapt, do you think?

In any case, this is the true power of the emerging paradigm - it is not even what it points to, although that is important, certainly. The really significant thing is not where it has come to at this point, but where it might go from here. What matters is that it is open to collaborative development for the first time, and also that it is entirely grounded in the real world - in biology, and evolution. It basically obeys

the laws of physics in the real universe, rather than being some mystical codex or arbitrary belief system. Which means that it is open to anyone smart enough to dig into it, most especially if that can be done as a group.

Therefore, and just to confirm - the potential people have been calling 'spiritual enlightenment' is a very real thing, but it is not 'spiritual' at all. It never was. That 'cosmic radiance' is only what it feels like when you experience it. What it is - what it actually is - can only ever be explained by the anatomy of what falls away in that transition, information that is presently completely absent at this time. Indeed, it is not only missing, but you would never find it even if you went looking. Once again, if that was true I wouldn't be saying any of this. I'm not totally crazy. This is very dangerous information.

The only thing that matters is that this very profound potential for sudden personal change exists, and that nobody even knows about it. Which means that the only thing required in this instance was just to point it out, and to explain what it all means. We only need to plant a flag in just the right spot, with a very clear description of what lies buried there, and the moment anyone starts to poke around there will very rapidly be a kind of digging frenzy that ensues. You won't be able to stop it. And it won't be long before they all dig deep enough to hit paydirt, and that's when the real explosion will occur. That's when the heavy equipment will arrive to help, and it won't be long before the entire thing is cleaned up and exposed, for everyone to see.

To plant this flag is the purpose of what you see here, and defining what lays buried there will also be the purpose of any subsequent resources that emerge over time. That digging is also the purpose of the website - it is all just so that anyone interested might be able to learn more, and also to be able to talk to others who have suddenly developed a similar curiosity.

So what does it all mean, exactly? If there really is something there, and if we dig it all up in this way, where will that leave us? What difference does it stand to make?

Part Five - AN ENTIRELY NEW WORLD

Let's assume for a moment that you have stayed with the argument so far, and that you basically grasp the outlines of what is being proposed. And let's say you wanted to explain it all to some random person, and in the process somehow impart the essence of what makes this 'the single most important thing to know about being human'.

How would you do that? What would you say if they questioned this seemingly absurd claim? I mean, they would certainly be justified in doing that, right?

First of all you would need to explain the broad anatomy of the current situation, and that if this is true then that situation is not quite what we imagined it to be. You would need to explain the very dramatic implications of the relatively basic claim that there is something important that we have overlooked, and the location of that error.

I mean, for anything to be overlooked in any other location might be more or less significant depending on what is being proposed, but anything at all overlooked in what we presume to be the 'looker' is always going to be an order of magnitude more important. It basically means that one of the actors on our own psychological stage, so to speak, is an imposter - and that they are secretly acting against us in very dramatic ways.

The other interesting thing about this particular insight is that it points in two directions at the same time. It immediately points to an issue deep within us on the one hand, but also points outwardly to explain a huge number of seemingly mysterious and intractable problems we face at the most collective level.

At the collective level this insight undermines some of the most common misconceptions about what is really going on in the world as a whole. People will often point a finger at the obscure and inscrutable motives of those in power in the world, and all the seemingly suspicious manipulations associated, and conclude that all the troubles in the world are coming from this 'terrible few'. But this emerging view does not support such a theory. In actuality - and this is both the best news and the worst news at the same time - the entire world is simply a reflection of the individual human heart. Because the individual is conflicted within themselves, that conflict is then expressed at the collective level - in just the same way as every pixel on your computer screen being red will result in your computer screen displaying red. It is unavoidable. And in this case, actually, those in power are just as conflicted as anyone else, except that they have been made responsible for somehow managing a situation that is essentially unmanageable.

So whilst it might sometimes look like the world is composed of a few cunning wolves who are preying freely on some great and feeble mob of sheep, in the end that is just the way sheep always see things. Unfortunately, in this instance, those at the top are also just sheep. Damn.

Which is not to say that such power is not real, but just that in this instance those with the power are just as confused as those who have none, and also that they really do have a lot less power than we imagine, certainly in relation to affecting any of our real problems.

In many ways this is sort of the most unfortunate thing of all - one of the main functions of politics is a sort of theatre, it is all about offering us an illusory sense that someone is actually in charge of all this, when in fact the entire event is spiralling out of control quite freely, and in ways that nobody is actually driving. There are no culprits in that situation, and if you imagine that you might be doing things differently if you were in that seat, you are mostly dreaming. Things are not quite that simple.

Weakness is not a virtue. The victim is not always right, and is often not even a victim at all. I'm with Douglas Murray on that one. And in this instance it is the powerless masses who are defining everything one way or another, not anyone at the top.

Anyway, that is the worst news. The darkest fact is that there is no political solution to the problems we face. None. That entire level of life and society is completely futile as a vehicle for change, if what we are saying here is correct, because you cannot take the pollution out of a river once it has been introduced at the source. And in this case the source is who? It is you.

We have 8 billion very polluted tributaries. The global situation is therefore inherently unstable if only because the individual units that make it up are unstable. The individual compass is spinning, and the way we break can take many different forms, none of which are particularly sustainable at an emotional level. We are all basically on fire, and forever looking outside ourselves for the source of our woes, all of which generates continual conflict and suspicion in the world we see around us. And I for one would never want to be placed in the position of trying to steer that leaky old ship in a way that left things better than I found them. After all, to be the captain on a ship of fools - that would only make you the biggest fool of all, right?

It all seems unfortunate, then, in that we have nobody to blame but ourselves. We can't point the finger in that case. But this is also the best news, because in that very same moment it also places the

power to change everything right back within our own personal domain. And yet, as welcome as that might sound, not everyone likes that fact - if only because it is a double edged sword. With power comes responsibility etc. Not to mention the obvious underlying implication associated with this shift in focus - that it is *you* that is the ultimate problem here.

Of course this is totally obvious if you think about it, and yet apparently completely overlooked by most, if only because most people are not aware of any significant possibilities within themselves for deep or lasting fundamental change. And so why bother thinking about options that don't exist? But this is only ignorance, and that's precisely what we are saying here.

Such a potential does indeed exist, and it is not only massive, but also within easy reach. The only reason it has not been made available long ago is not because it might be difficult for the collective to make this possibility available to all, but simply because it has remained hidden in plain sight, right in front of us. It is just that nobody was ever smart enough to find it in the first place, but then also dumb enough to point it out. That person would need to be both sane and insane at the same time, in the same sense. And where would you find someone like that? The tidal forces associated with that sort of psychological state would literally tear them apart.

So anyway, here we come to the most obvious, uncomfortable, but also exciting bedrock implication this emerging paradigm delivers: the big shift you have been looking for was never 'out there somewhere', it was always 'right here where you stand'.

That 'totally new world' was always going to demand that you become a 'totally different person'.

And that is what makes this insight the most important thing there is to know. It is because the differentiation of these two events for the first time not only defines all the twisted anatomy of our current trapped situation, but that it also defines the added activity as being both singular in origin as well as not intrinsic to us. And, most importantly, that we have not even been aware of this fact, precisely because it is true.

This is how something so small can relate to something so big. It is all about the way the situation is stacked in a very particular way so as to allow for a small spark of intelligent courage to ignite an enormous fire of positive change. It is all about the ability of what is actually just a simple piece of missing information to eventually make this potential available to all people, everywhere, all at once.

To understand this aspect, we really need to know in more detail how that might work. And here we need to introduce another common motif you will find repeated throughout this work - something we might call an 'event spiral' or a 'functional cascade'.

If we go back to the 'two bowls' analogy for a moment - except this time we might imagine we are examining the entire human collective as a whole - the same dynamic is implied.

Once again, to visualise this, think of that big impact crater out in the desert, and that much smaller one just next to it. We are, as a group, currently all located in the shallow depression, the wrong equilibrium so to speak. Bearing in mind here, once again, that 'elevation' in this model is stress, unhappiness basically, so that even the lowest point in this artificial equilibrium would still be very elevated compared to the lowest point within the big bowl of the natural equilibrium we biologically expect. This is why the world is the way it is, and also why nothing will ever change whilst all the individuals remain in that sorry state.

However, this time you will need to imagine what 8 billion balls might look like in a bowl, and how that might work. At that macro level what we would see is not a ball but a liquid, that this vast collective would move like water - it would be like a lake in the middle of this artificially elevated second bowl.

The thing to see here is this: What separates these two bowls? A kind of hump, right? A high peak or ridge? But as I say - if you were in the second bowl, could you see the other bowl from there? Nope. Would you even know which direction it was? Nope.

But imagine this: What if even just a few people did have this information, and what if they poked even just a tiny hole in that great dam?

What would happen next?

This is what I mean when I use the term - (functional cascade). There are many circumstances in the real world where such an event might occur - where things might appear entirely stable for a time, maybe even a very long time, but then the entire system will begin to move in a way that nobody even knew was possible. And most importantly of all, that a cascading event will generally be very difficult to arrest. They simply cannot be stopped, not until they have achieved the release of the tension or loading that resulted in their formation in the first place.

Like a bullet fired from a gun, the best way to stop a cascade is simply to not pull the trigger in the first place. All the other options are a bit more problematic, not to mention a bit messy.

This is the concealed punchline to the big joke here. This is what people generally don't see until they penetrate the entire anatomy sufficiently, and also with the cognitive capacities required to model all of the associated variables in their own head. This was the part that I always tended to leave unsaid, and not only as a sort of intelligence test, but also because it is just sort of embarrassing to say out loud. But it is unavoidable once you put all the pieces of this puzzle together here.

This is what the entire thing points to - it is all about this very heavily loaded context, where a huge amount of energy is presently being held back by only the smallest of triggering events, and that nobody even knows where that trigger is, or what it all means. They are not aware that this entire situation even exists.

In this case, then, and because the pressure being indicated is essentially a sea of human unhappiness, the moment this small triggering event occurs the entire thing will become immediately unstoppable. There will be no way to plug that hole again even if anyone wanted to, which they won't. Which means that before long that small hole will become a roaring torrent, and the entire lake will - for a time - transform into a river in a sense, as it empties out back into the big bowl again, where it belongs. And yes, sorry to labour the metaphor, but sometimes a simple model can better explain a somewhat dynamic situation.

This is what it means for the missing information to be emerging here at last. It is all about identifying the true origins of our deepest problems on the one hand, and thereby finally scratching a deep philosophical itch that has plagued us for millenia. But more importantly it is about explaining (to anyone brave enough to actually take a look) that the power to very dramatically alter the entire trajectory of human civilization is currently resting within the easy reach of just a few brave people.

It is actually so close, and so clearly within reach, that we have to conclude that the only thing that has ever prevented this from occurring centuries ago is just that we didn't know it was there - not in the terms that matter, as I say. And this is the power of what is being explained here.

We simply didn't know that there were two things going on, rather than one, or how vast and dynamic the secondary event actually is. And we didn't know this because the entire function and purpose of that subversive activity is to keep precisely that information from ever reaching conscious awareness, both individually as well as culturally speaking.

Therefore, the one thing that would change everything, for everyone, is also the one thing we are not allowed to know, or even to look at. So it was all very stable for as long as that lasted, and for as long as nobody rocked the boat in this way. Sorry about that. But it was actually always a very fragile situation in this sense, because even though it was very stable for as long as everybody played the game, the moment even one person decided to defy all the common 'rules' the entire scheme was basically over. Someone only needed to have sufficient disrespect for the cherished values and rules of common culture to climb up to the top of that hill and actually take a look for themselves, and maybe even to camp up there for years, in order to figure it all out. It only ever had to happen once.

So anyway, what is that triggering event? What is the small hole in that dyke that might inevitably lead to the great torrent of transformation? Can that ever be achieved by a single individual? No. This part is implied, it is defined by the very nature of the context. Some things are collective by definition.

But could that critical trigger be reached by even a small group of people, assuming they knew what they were doing? Sure. Like the manhattan project, you could probably fit all the really key players in a single minivan. They just need to be the right people, and to have the right information available.

That point is simply the moment when any small collective gets together to penetrate this emerging theory deeply enough to be able to extract from that any workable application that can reliably facilitate this transition event in any individual - even a very rare person at first, as long as that type of person can be readily identified. Because at that moment a kind of spiralling development loop will occur, where practical success will immediately feed back into theoretical development. Which will in turn inform further application in practice, and so on - thereby increasing the power and efficiency at both ends with every turn of the screw. And with that the new game will have begun.

To be clear, however, this triggering event will not be localised, and it will not be contained in any sense - not unless all of this occurs in secret, which is unlikely. The key thing is that the type of change associated will then be able to be reliably repeated by anyone who has the essential information associated, and who - most importantly - has enough secure belief that pursuing such a path might feasibly bear such fruit.

And this is why that first proof of concept will be so powerful - it will not be about the difference it will make for the first few people who are assisted in this manner by whatever small cultural event manages to facilitate that relinquishment in them. It will not even be about the way the reliable achievement of such an outcome will immediately make subsequent attempts more likely to succeed, or the kind of spiralling development this might lead to within that local context. It will all be about the way this first small demonstration practically and reliably confirms the very simple (but supremely significant) fact that there are indeed two things going on within us, and that one of them really can be entirely undone. Because whilst it might sound almost trivial at first glance, this is actually a practical and philosophical bombshell.

I need to be clear here about exactly what this means. This is not what people currently presume, and as a result this is not something they are even pursuing. Indeed they don't even know this outcome exists, or what it all might mean. By which I mean, it is not something they have at some point examined and then put aside as either false or irrelevant, but that they have never even been made

aware of the possibility in the first place. The whole concept remains completely outside the current cultural paradigm. And this fact will not change based on the mere suggestion that such a potential really does exist. It is simply too deep a claim to be taken on faith.

So at present this is only a theory - a dumb idea put forward by a complete nobody about very extreme stuff that cannot be poked with any sort of scientific stick, and which might therefore be entirely fallacious.

Yes, I get it. I really do. But here's the thing, the moment this theory begins to produce the very dramatic and unexpected outcome that it alone predicted was there, the entire ball of string will begin to unravel, as I say. A fire of change will have been lit, and that fire will not in any way be contained. It will jump any fence, spread like a virus, essentially at the speed of light - given that it will be information based. And what this means is that - like the Wright brothers - the event in question will not then just be happening somewhere, it will be happening everywhere. Because the only reason all of this inner struggle is still the daily reality for almost every person on the planet is because people always look away. Nobody talks about it.

The entire thing exists in a kind of collective blind spot. People just don't realise that the one thing they have been so afraid to go near paradoxically held the secret to their salvation. But the moment that singular event occurs, the moment it begins to spiral in this upward manner, the entire cultural gaze will descend on that spot like a floodlight - and with that, it will absolutely fucking explode. And the moment that happens, this potential will be very rapidly moved up to the top of the human enterprise chain.

What does this mean? It means it will suddenly be thinktanks, research institutes, and functional fMRI machines - rather than just a few people fucking around with a bit of deep breathing in someones suburban backyard. We will go from Wright brothers to jumbo jets in a flash - and soon enough, like Ubers, it will be completely ubiquitous. The whole thing will be over before anyone even realises what is going on, and we will all be left standing there - dazed and in shock - waiting for the dust to settle on a whole new state of being, and an entirely new world.

Therefore, what we are actually looking at here is a new form of subjective technology, a kind of cultural mechanics in a sense. Because it turns out that there is not only one thing you might do in order to make that transition more easily available to the average person, there are actually many such things, but all of those will only ever be delivered in some sort of culturally institutionalised context. These are collective events by definition, in just the same way as bullet trains are collective events. No individual can build one, or even drive one, but the collective can do that easily.

The key to all of it is just that we didn't even know it was there, how it works, or what it all might mean. And, therefore, what we see is that nobody is even working on it. Not one person, anywhere, not in the only terms that matter.

Even in the few instances where people have correctly concluded that 'some mysterious potential' does exist, they are always missing the singular and pivotal paradigm shift that very suddenly stands the whole thing up the right way at last. And as a result of the omission of this one big missing piece, the single greatest transformative event in human history is still just sitting there, right in front of us, and we don't even know it.

Therefore, what does it mean now that this missing information is coming to light, and how much detail will be required in order to tip the balance here?

It remains entirely unclear. If the world is ready then just a single spark in just the right place will light the entire thing up. But if the world is still not ready then it will be like trying to light a wet blanket. So I guess we'll see. Which one are you? Do you feel ready? Or are you a wet blanket? I suppose this will be the defining element.

So what might be the consequences of pointing it all out in this way? What will happen now?

In most cases, nothing will happen. Nothing at all, most likely. Why? Because it is true. What this means is that you can scream this out at the top of your lungs, even in a crowded restaurant, and still nobody will hear you. It will just bounce off the psychological and emotional armour people are wearing, and they won't even hear the thump. Or, even worse, and even if you do manage to find a chink in that armour, the entire group will then jump on you like a rugby scrum just to shut you up. It will definitely not be appreciated.

But we should be clear about this point - that will not stop it now. Not if you are understanding anything I am saying here, about what it all might mean. Because if you are grasping this, then so will others, and we only ever needed a few in this instance in order for the entire thing to make its way forward and gradually into the hands of the few who matter. Because in this instance, whilst most people are completely immune to even seeing it, only a dedicated few will be required in order to open the whole thing up for everyone. And for that, in the end, the only thing it requires is for it to be true.

And it is.

This is what I mean about it being a technology - the whole point of the cultural development being indicated is that it will completely bypass the limitations of the typical person in this sense. They won't need to understand it at all in order to gain access to all the benefits associated. People will simply flock to it, and they won't even know what it is. All they will know is that someone is offering 'deep and permanent happiness, for free'.

Just to be clear, then - and just like the essential transition between one state and the other - with the very first achievement of even a small 'spiralling development capable of reliably stimulating this transition in a known test audience' we are already living in the new world. At that very moment the old world has already gone, and a new one has arrived, even if that might take decades to fully unfold. Because at that moment it will not be able to be stopped, and it will not terminate naturally until the very last vestiges of that pandemic of human suffering have been extinguished fully.

Anyway, you really do need to take a moment to contemplate just how near this point is, how few it will take to reach it, and how big the events in question are. And then consider what little those few will require in order to begin that brief journey. This is all very close, and entirely within reach of just a small group of very smart people. It literally places the power to change the entire world in the hands of any small group with the curiosity to look, the brains to understand, and the courage to act. The missing information is now available, at least in some sense. So the only question remaining now is this - are those rare people actually out there?
